Getting Started with Container Networks

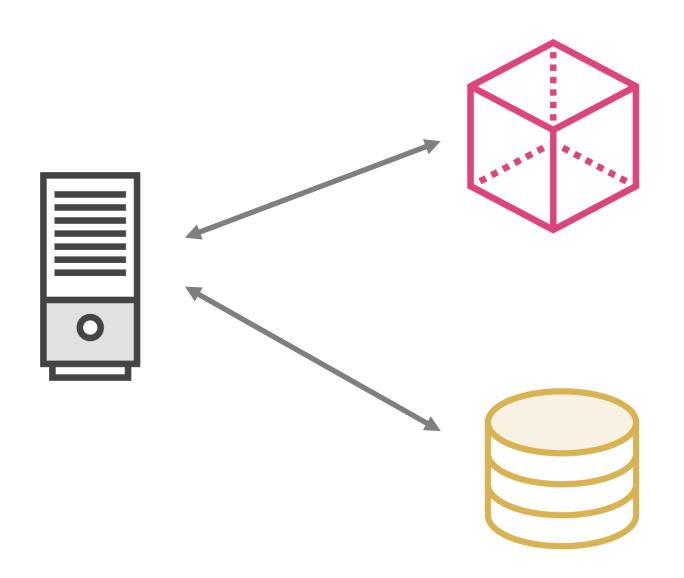

Container Networks in Action

Linking Multiple Containers

Getting Started with Container Networks

The Need for Container Networking

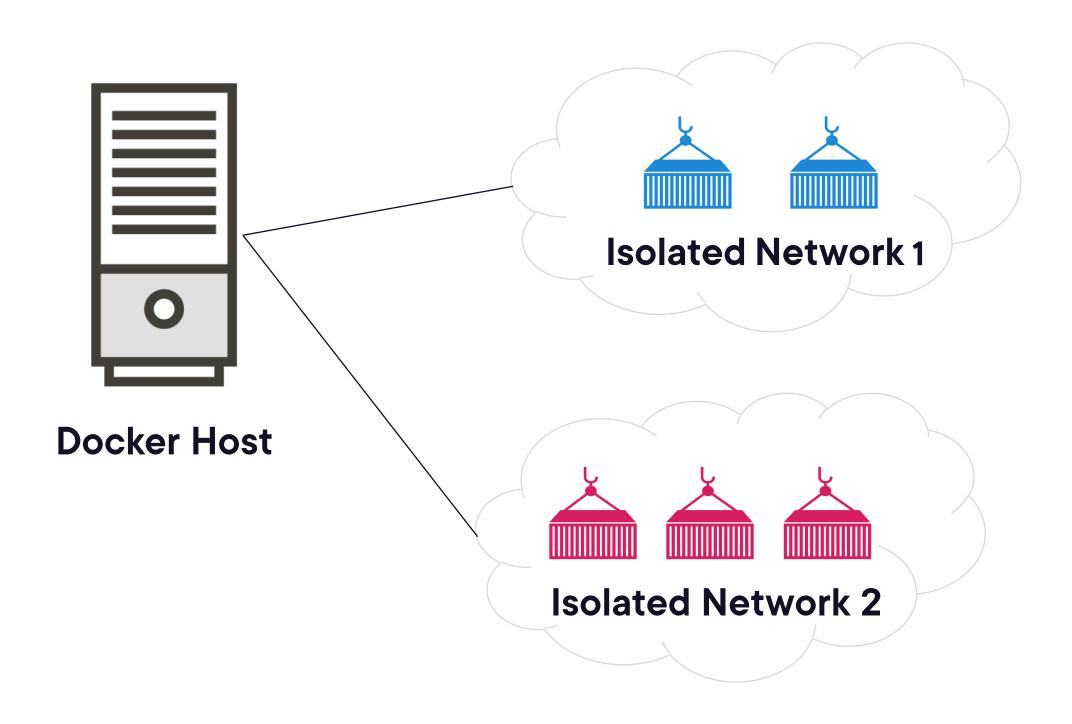

Docker Container Networking Options

Use Legacy Linking

Add Containers to a Network

Understanding Container Networks

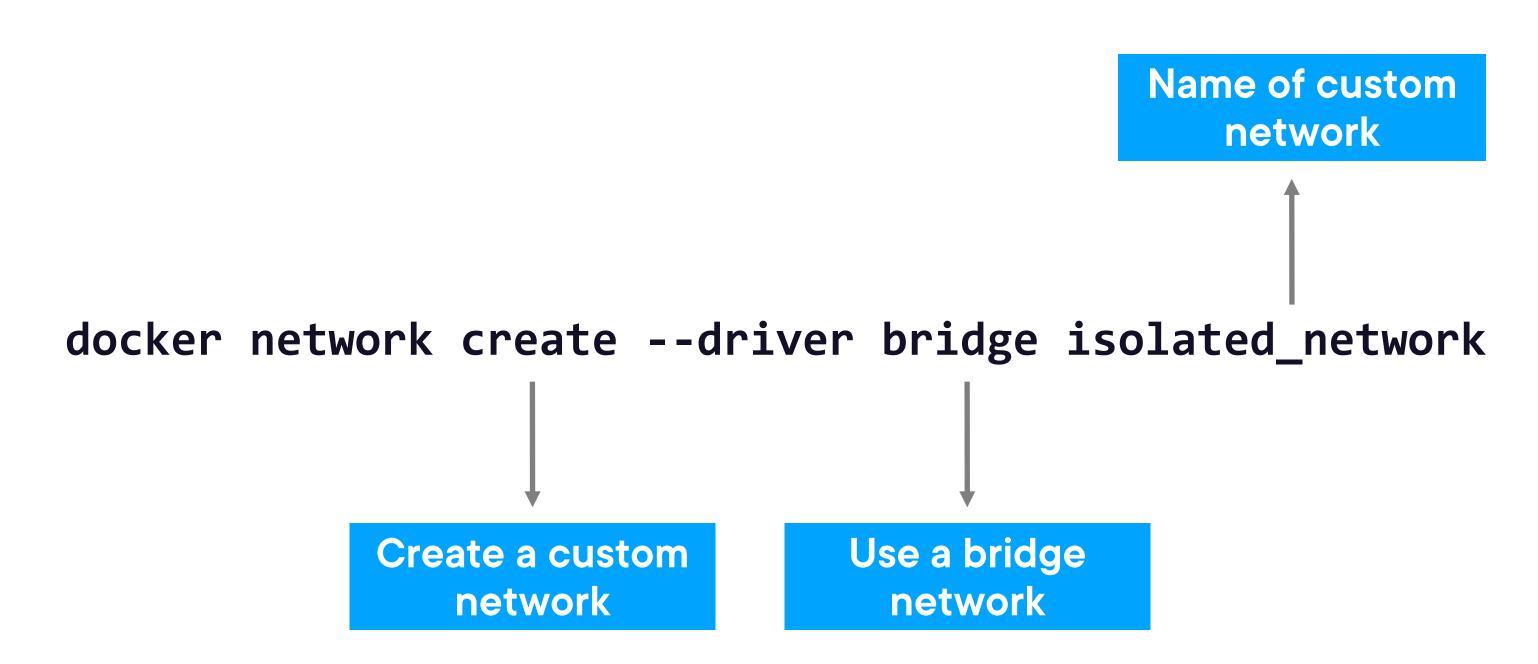

Steps to Create a Container Network

Create a Custom Bridge Network

Run Containers in the Network

1 Create a Custom Container Network

2

Run Containers in the Container Network

"Link" to this container by name docker run -d --network=isolated_network --name mongodb mongo Run container in network

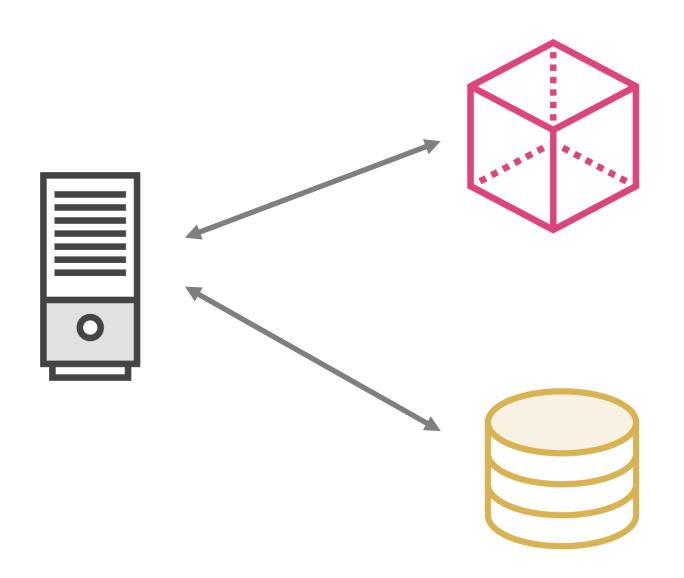

Container Networks in Action

Communicating Between Many Containers

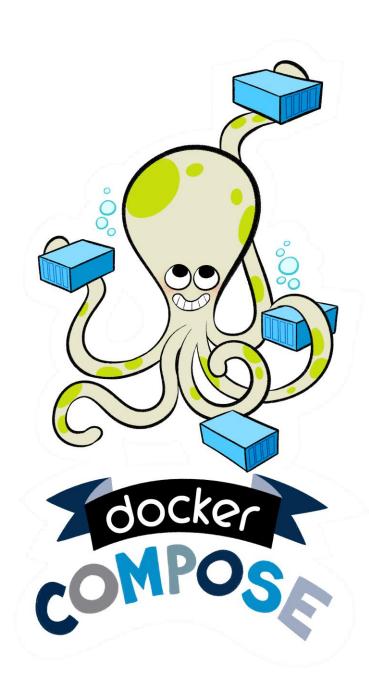

The Need for Container Networking

Docker Compose Can Simplify Container Networking

Summary

Docker containers communicate using a network

The --network command-line switch can be used to setup a network

Docker Compose can be used to setup networking between multiple containers
